

Exercise-set 2.
Solutions

1. (a) yes, yes,
(b) no, no,
(c) no, yes,
(d) no, yes.
2. 8 (the smallest possible and also realizable degree-sequence is 0,1,2,3,4,6).
3. There are $n - 1$ odd degrees $\implies n - 1$ is even, n is odd \implies one even degree in \overline{G} .
4. 24.
5. The number of edges between the vertices of degree ≤ 7 and the vertices of degree ≥ 16 is both ≤ 70 and $\geq 70 \implies = 70 \implies |E(G)| = 115$.
6. There are 11 of them.
7. There are 2 of them.
8. There are 1, 2 3 an 6 of them, respectively.
9. a) There are 4 such graphs,
b) there are 4 such graphs,
c) there are 2 such graphs.
10. a) Yes, yes, no (should have $15/2$ edges).
b) No (should have 11 vertices and $55/2$ edges).
11. a) no, b) yes.
12. a) and b) are isomorphic, and c) is not isomorphic to them.
13. a) and b) are isomorphic to it, c) is not.
14. No. The underlying graph is a cycle, and the knights cannot change their order on it.
15. a) For non-simple graphs no.
b) For simple graphs yes: they cannot have (at least) 2 components.
16. The graph cannot have 3 components.
17. There are at most 2 components.
18. If G is not connected, then the edges between the components of it make \overline{G} connected.
19. In every connected component of a graph there is an even number of odd-degree vertices.
